THIRD IMPLEMENTATION PROMPT

Story Enemies in Godot

Use the supplied Zombie Villager and Skeleton Warrior as the cemetery storyline enemies. Build clean Godot animation states, make their Easy versions slow and readable, and keep them powerful enough to feel dangerous without becoming unfair.

Skeleton Warrior

Armed cemetery defender raised by the Wizard

Zombie Villager

Corrupted former citizen of Silent City

The pictures above are simple reference frames taken directly from the supplied Idle animation sequences. Use the full PNG sequences for the game animations.

1. Objective

Act as the implementation engineer for the existing Godot game. Integrate the two newly supplied character packs into story mode as cemetery enemies and connect them to the grave-emergence encounters described in the cemetery continuation prompt.

> **Do not replace the playable Golem. These characters are enemies: Zombie Villager is the slow corrupted civilian; Skeleton Warrior is the trained but still Easy-mode cemetery fighter.**

Implement, test, and report the finished result. Do not stop at a plan unless the project is genuinely missing the playable game files or another required dependency.

Asset locations

- Zombie: Second_prompt/zombies, skeletons/Zombie_Villager_2/PNG/PNG Sequences
- Skeleton: Second_prompt/zombies, skeletons/Skeleton_Warrior_1/PNG/PNG Sequences
- Each pack also contains Vector Parts, AI source art, a Unity package, a readme, and a license reference. For Godot, use the supplied PNG sequences unless the existing project already has a proven SCML workflow.

Asset protection and licensing

- Do not edit or overwrite the original source packs. Copy only the required runtime PNG frames into a clearly named story-mode asset location if the project requires imported copies.
- Keep the supplied license/readme material with the project documentation and confirm the asset entitlement before release.
- Do not import the Unity packages into Godot and do not add external replacement artwork.

Scope safety

- Story mode only. Do not modify online mode, multiplayer enemy scenes, networking, synchronization, lobbies, or shared online maps.
- If an enemy base class or damage resource is shared, extend or duplicate it in a story-only way instead of changing online behavior.
- Preserve unrelated work and the completed cemetery-road extension.

2. Mandatory asset and project audit

Before editing, inspect and record:

1. The current Godot version, renderer, story-mode level scene, player/Golem collision size, camera zoom, HUD enemy counter, and damage conventions.
2. The existing enemy scene architecture: CharacterBody2D or other root, state machine, hitbox/hurtbox system, health component, detection areas, movement, death cleanup, and spawn ownership.
3. How the project imports animated PNG sequences and whether AnimatedSprite2D/SpriteFrames or AnimationPlayer is the established pattern.
4. The exact frame dimensions, transparency, visible bounds, orientation, and pivot consistency across both supplied packs.
5. The grave encounter controller and the exact signal/state used to change an enemy from emerging to active.
6. Which candidate resources are story-only and which are shared with online mode.

Verified source animation groups

Both supplied packs contain the same 17 folders:

- Dying (15), Falling Down (6), Hurt (12), Idle (18), Idle Blinking (18), Jump Loop (6), Jump Start (6), Kicking (12).
- Run Slashing (12), Run Throwing (12), Running (12), Slashing (12), Slashing in The Air (12), Sliding (6), Throwing (12), Throwing in The Air (12), Walking (24).

The number in parentheses is the supplied frame count. Do not assume every available animation belongs in the Easy enemy behavior.

Import guidance

- Preserve alpha transparency and full color. Use lossless 2D import settings.
- Because this is smooth high-resolution cartoon art, keep texture filtering enabled unless the rest of the game intentionally uses nearest-neighbor pixel art.
- Use one consistent visual scale per enemy. Do not resize individual frames or change pivots frame by frame.
- The PNG frames share a 900 x 900 canvas, so build SpriteFrames from the sequences and keep a stable centered origin. Verify the feet do not slide vertically between states.
- Load only the animations required for the shipped enemy behavior when memory matters; do not import every action merely because it exists.

3. Godot enemy scene structure

Follow the project's naming conventions. If no equivalent exists, use a reusable scene structure similar to:

- CharacterBody2D root with the story-only enemy controller.
- AnimatedSprite2D for the supplied PNG frame sequences.
- CollisionShape2D fitted to the torso/feet, not to the full 900 x 900 transparent canvas.
- Hurtbox Area2D and attack Hitbox Area2D using the project's existing layers/masks.
- Player detection and attack-range Area2D nodes.
- Optional ground/wall RayCast2D nodes if the current enemy navigation pattern needs them.
- A visible-origin marker or spawn anchor used by the grave-emergence controller.
- Audio/particle hooks only when matching existing project assets are available.

Required states

- DORMANT: hidden below or behind the assigned grave; movement, contact damage, hitbox, and AI disabled.
- EMERGING: grave telegraph is active; sprite rises into view using a story-only tween or AnimationPlayer track; hostile collision remains disabled.
- IDLE: brief awareness pause after emergence.
- WALK/CHASE: slow ground movement toward the player while respecting ledges and cemetery obstacles.
- WINDUP/ATTACK/RECOVERY: clear attack phases synchronized to the selected animation frames.
- HURT: brief reaction with movement interruption according to the project's combat rules.
- DYING/DEAD: play once, disable all damage immediately, then notify the encounter/HUD and clean up safely.

Animation mapping

- Use Idle or Idle Blinking for calm states. Randomize occasional blinking without restarting every frame.
- Use Walking for Easy-mode movement. Do not use Running for the default Easy versions.
- Use Slashing for the Skeleton Warrior's sword attack.
- Use Kicking or Slashing for the Zombie only after checking which silhouette matches the intended simple melee behavior. Prefer one attack, not multiple combos.
- Use Hurt and Dying for damage and death. Dying must be non-looping.
- Do not use Jump, Sliding, Throwing, aerial attacks, run attacks, or projectile behavior for the Easy versions unless the level requires it and the user approves it.

Animation timing

Start near 8-10 fps for Idle/Walking, 10-12 fps for attacks and Hurt, and 8-10 fps for Dying. Tune by visual inspection. Place the hitbox only on the real impact frames, never for the full attack animation.

4. Easy storyline behavior and balance

Design target: slow and slightly powerful, but clearly an Easy-mode enemy. The player should respect the hit, understand the warning, and recover after a mistake.

Zombie Villager - slow pressure

- Story role: a former Silent City villager raised and corrupted by the Wizard. The enemy should feel tragic and heavy, not fast or acrobatic.
- Move at roughly 35-45 percent of the player's normal ground speed as a starting range.
- Use a short detection delay, slow turn, large readable wind-up, one close melee action, and a long recovery.
- Target durability: usually defeated by about 2-3 normal player hits after measuring the real damage system.
- Target damage: meaningful but not punishing; normally no more than one standard heart/health unit on Easy, with the player's normal invulnerability window respected.
- Do not give the Easy zombie running, jumping, throwing, aerial attacks, attack chains, or sudden gap-closing behavior.

Skeleton Warrior - readable trained fighter

- Story role: an old cemetery guard or fallen warrior reanimated by the Wizard. It is more disciplined than the zombie but remains an early-story enemy.
- Move at roughly 45-60 percent of player speed as a starting range, still slower than the player.
- Use one sword slash with a clear wind-up, short active hitbox, and visible recovery.
- Target durability: usually about 2 normal player hits, or slightly less health than the zombie.
- Target damage: similar to the zombie on Easy; difficulty comes from slightly better timing and reach, not excessive damage.
- Do not use throwing, run-slash, jump attacks, or multi-hit chains for the Easy skeleton.

Fairness rules

- Never let either enemy attack during grave emergence.
- After emergence, provide a short recognition pause before pursuit.
- Do not spawn directly on the player or surround the player without open escape space.
- Avoid contact damage if the project's existing enemies use explicit attacks. If contact damage is standard, keep it consistent and prevent repeated damage every physics frame.
- Use exported/configurable values or difficulty resources so Medium/Hard can later change speed, health, reaction, and cooldowns without duplicating scripts.

5. Grave integration and storyline presentation

Connect the two enemy scenes to the cemetery graves from the previous continuation prompt.

1. Keep the enemy dormant below the grave line or hidden behind the grave marker.
2. When the player enters the encounter trigger, show a grave shake, soil movement, dust, or an available sound cue.
3. Raise the sprite into view over approximately 0.8-1.25 seconds using a tween/AnimationPlayer track while hostile collision and AI remain disabled.
4. At the top, play a short Idle pose, enable the fitted body collision and hurtbox, then enter WALK/CHASE.
5. Register the enemy with the existing enemy counter exactly once. On death, unregister exactly once.
6. On checkpoint reload or death, restore the grave and enemy according to the project's normal reset policy. Never leave a half-emerged sprite or duplicate counter entry.

Story use

- First grave: one Zombie Villager teaches the slow emergence mechanic in open space.
- Second encounter: one Skeleton Warrior introduces the sword wind-up and slightly longer reach.
- Main cemetery row: mix zombies and skeletons in staggered releases, with a low active-enemy cap.
- Use zombies near village graves, coffins, or damaged civilian markers; use skeleton warriors near old guard graves, stone fences, crypts, or weapon remains when the level art supports that distinction.
- The enemies are evidence of the Wizard's corruption and the city's fall. Their presentation should support the story without long dialogue interruptions.

Visual integration

- Match both enemies to the Golem's gameplay scale. Their heads may be stylized and large, but their feet, collision height, and attack range must feel grounded.
- Keep enough contrast against the new charcoal-dark background. Do not use a global blue tint that destroys their natural colors.
- Lantern light may softly reveal them as they emerge, but avoid bright full-screen lighting or excessive glow.
- Flip the AnimatedSprite2D horizontally for direction unless the project has separate left/right logic. Do not mirror collision shapes incorrectly.

6. Testing and acceptance

Required tests

- Verify every used sequence plays in the correct frame order, speed, loop mode, and orientation.
- Check that feet remain planted consistently and the collision shape does not jump between animations.
- Confirm attack hitboxes activate only on impact frames and cannot hit through impossible distance or behind the enemy.
- Test both enemies when approached slowly, sprinted past, jumped over, attacked during wind-up, and hit during recovery.
- Test death during movement and attack. Damage must stop immediately and Dying must play once.
- Test grave emergence, enemy counting, scene reload, checkpoint reload, and player death repeatedly for duplicates and stale state.
- Test all playable Golems against both enemies on Easy using real health, attack range, knockback, and movement values.
- Check performance and memory with the maximum planned number of active enemies and imported animation frames.
- Confirm the new enemy assets and code are story-only and online mode remains unchanged.

Acceptance criteria

- Zombie Villager and Skeleton Warrior exist as functional reusable story enemy scenes in Godot.
- Both use the supplied PNG sequence art and have clean Idle, Walking, Attack, Hurt, and Dying behavior.
- Easy versions walk slowly, use one readable melee attack each, and feel strong enough to matter without unfair speed, health, damage, or attack chains.
- Both emerge visibly from graves before combat and cannot damage the player during emergence.
- Animation, body collision, hurtboxes, attack hitboxes, facing, ledges, death, reset, and HUD counting work reliably.
- Unused advanced animation groups do not accidentally become active Easy behaviors.
- The characters remain visually readable in the darker, less-blue cemetery.
- No source asset pack was overwritten, no external artwork was added, and no online/multiplayer behavior changed.

7. Final delivery

Final report

Return the changed-file list, imported animation list and fps/loop settings, final Easy balance values, grave-state behavior, tests run, results, asset/license notes, known limitations, and explicit online-mode isolation confirmation.

Do not claim completion from scene setup alone. Completion requires a playable Easy-mode test with both enemies emerging, walking, attacking, taking damage, dying, resetting, and updating the HUD correctly.

END OF IMPLEMENTATION PROMPT
